II.

The lipid profile of the genome-carrying mutant with avermectin resistance. Avermectin-sensitive (Am(S)) and -resistant (Am(R)) mutants of *Streptomyces lividans* and their parent strain were examined for alterations in their total lipid content. Total lipids were extracted and separated by TLC into several fractions. The TLC profile of a representative Am(R) mutant was examined in detail and

compared with that of the parent strain. The Am(R) mutant showed significant differences in the TLC profile of total lipids and was found to contain a remarkable amount of cholesterol, which was absent from the parent strain. The abundance of this lipid was supported by chemical analysis. The TLC profiles of the mycelial cell wall lipids, hydrolyzed cell wall lipids, and total lipids of the Am(R) mutant showed a

remarkable quantitative change. A striking quantitative reduction in the quantities of all the lipid fractions was observed. The results support the hypothesis that the Am(R) mutation causes a defect in the synthesis of an unknown lipid(s), either a precursor for the generation of the mycelial cell wall, a precursor for the biosynthesis of the cell wall glycolipids, or for the permeability of the bacterial

membrane, and that this defect in the Am(R) mutant is inversely related to resistance to avermectin.!
