And here is the link to BiologiaGeneralClaudeVilleepdf Crack Keygen's ChangeLog file, where BiologiaGeneralClaudeVilleepdf has recently added a number of new features, improvements and/or changes:Q: Why does this C# MailMessage object have a different contents from the "To" property? I am creating a C# MailMessage object and I would like to add a "CC" and "BCC" properties, which I can do. My problem is, when I do, the "CC" and "BCC" have different contents than the actual "To" address. Here is an example of my code: var mail = new MailMessage(); mail.To.Add(new MailAddress("example@me.com")); mail.CC.Add(new MailAddress("example@me.com")); I believe the values in the "To" property are coming from the To array, but that doesn't seem to be the case in this code. The "CC" and "BCC" properties are always empty strings. Here is a screen shot of what happens when I use the above code: As you can see, "example@me.com" is in the "To" and "CC" and "BCC" properties are empty strings. A: The To, CC, and BCC properties are read-only. See the MSDN documentation for MailAddress. A: The To property is read-only. It is the default value of the SendTo property, so if you need to manipulate the To-property after creating the MailMessage-object, you must set the SendTo property to an empty string instead of the default. mail.SendTo = ""; /** * Copyright (c) 2010-2020 Contributors to the openHAB project ** See the NOTICE file(s) distributed with this work for additional * information. ** This program and the accompanying materials are made available under the * terms of the Eclipse Public License 2.0 which is available at * * * SPDX-License-Identifier: EPL-2.0 */ package org.openhab.binding.hekinematica.internal.messages; import
