The only real reason that I'd mention the first book is that it starts with a real challenge, the famous Rolle's theorem (which is a part of elementary calculus, but which is very important), which I think is a great way to start some basic intuition: The function  $f$  is continuous, has a local maximum in  $x = a$  and a local minimum in  $x = b$ , and  $f(a) > f(b)$ . Given that  $f$  is continuous, we need to prove that there is some  $c$  such that  $f(c) = f(a)$ . This is a great and easy introduction to a proof

you won't forget easily. For most real analysis texts (Rudin, Bartle, Katz), the study of complex numbers is done by limiting the class to real numbers. In the second edition of Rudin's Principles, this was done by defining complex numbers as an extension of the real numbers that might at times make it easier to think in terms of complex numbers (rather than the more straight-forward real numbers). Unfortunately, this can be misleading: if you are studying real analysis with a concentration on the basics, then the mathematical beauty of a pure complex analysis approach becomes apparent; however, many mathematical treatises on real analysis focus heavily on real analysis and thus might gloss over the subtleties of the more complex approach. Now this is a tough question and I am not sure if there is a simple answer. However if I have to choose it would be Ammon's text, Calculus is more than functions of one variable. It introduces the integral and the definite integral plus some more basic stuff. After that, I suggest going to Folland's or else Pugh's Real Mathematical Analysis.
