FG-X is a plugin in the AudioSuite plugins package. The following table shows where to find the known FG-X related plugins. A: Short Answer: Yes you can use them, but they are not well supported. Long Answer: First the last version of the Slate Digital FG-X plugin for both TDM and VST is 1.1.2. They added mono input/output No one

seems to have the time to do bugfixes for it and the AudioSuite developers don't seem to even care. Possible Solutions: There's already a version of the FG-X from DFX Technology - DFXi 2 that allows for TDM and VST. It's here: If you can, get the new version from DFX - its the version after the 1.1.2. There's also FLUX for TDM version of FG-X which is an update to DFXi and is highly recommended. It's here: If your VST version of FG-X doesn't work on your host, there's a plugin called FG-X VST AudioSuite plugin which is also a rebrand of the DFXi Plugin. It's here: Easy fix: As far as I can tell FG-X can only record and playback a mono source. So if your vst pro tool gives you a stereo input, the best you can do is have one mono input and record it to a mono track in the TG-X plugin. VST & MIDI Recording You can't use the TDM for recording and playback if you have a VST plugin controlling a MIDI channel. I don't know what happens if you try to do that but I suspect there is a VST effect that assumes you are recording MIDI and not audio. I'll try to find out. I know that there is a limitations list. UPDATE: It's unclear if this plugin: is correctly using a VST effect for recording and playback, but you can test it out if you want. To do so, first configure your DAW to send all MIDI channels

Skype (The Free Voice Chat Software) Download Skype (The Free Voice Chat Software) Download Skype - is a free instant messaging and VoIP telephony client. The company behind the app is called Skype. Skype was created in 2002 as InviteMe, a small company that was working on a voice chat app for the Windows, Mac and Linux platforms.
