the related art, different

types of devices for

detecting a tilting degree

of a vehicle may be provided. As one of the related art devices for detecting a tilting degree of a vehicle, there is a vehicle dynamic stability control system disclosed in Patent Document 1. In the vehicle dynamic stability control system disclosed in Patent Document 1, a so-called yaw rate is calculated using a yaw rate sensor.

Then, when an estimated yaw rate exceeds a predefined value, a yaw rate-reduction control is performed by individually changing a target yaw rate and a target yaw acceleration. In addition, a lateral acceleration which occurs at the time of right or left turn is calculated based on a yaw rate sensor and a lateral acceleration

sensor. The left-right sides of the vehicle are divided into two regions, a region on a lower left side where the lateral acceleration is positive, and a region on a lower right side where the lateral acceleration is negative. Then, when a tilting degree of the vehicle is determined based on the lateral acceleration, it is judged

which region the vehicle tilting degree has reached. The above-described vehicle dynamic stability control system has a problem that there are cases where a correcting operation is not made even when the vehicle tilting degree exceeds a tilting degree in which the vehicle needs to be corrected. In addition,

there is another problem that when the above-described detecting process is performed, a time delay is caused, and a time delay arises in the occurrence of an unrequired correcting operation. Patent Document 1: Japanese Unexamined Patent Application Publication No. 2011-1872 is improbable. All the

procedures were done in the same laboratory, which included the immunoassay and glucagon testing. The analytical variability was estimated by the results of the testing of 25 patient samples \[\[@CR19 \]\]. We did not include other immunoassay procedures in our study because this would have involved

additional laboratory tests and there was no need to prove the biological variability of the glucagon assay. However, we believe that the immunoassay procedure should have been used, since it is known to be the only test used in clinical practice. This study has several limitations. First, the number of subjects was not large.
