Cost-effectiveness of CA125 measurement in the management of patients with epithelial ovarian cancer. In patients with newly diagnosed epithelial ovarian cancer, the tumor marker CA125 is helpful in screening and staging. Treatment decisions and follow-up should be guided by the stage of disease. We performed a cost-effectiveness analysis of CA125 measurements in patients with epithelial ovarian cancer. At diagnosis,

an initial CA125 level was determined in patients treated with surgical cytoreduction and adjuvant or primary chemotherapy, and a second CA125 level was obtained at recurrence in the cohort of patients who subsequently received chemotherapy. The costs of testing and treatment were estimated based on resource utilization data obtained from the Spanish National Health System. A decision model that incorporated costs, quality-adjusted life years (QALYs), and incremental cost-effectiveness ratios (ICERs) was developed. One-way sensitivity analyses and threshold analysis were performed to evaluate the robustness of the findings. After a follow-up of 1 year, CA125 testing did not improve outcomes and was not cost-effective. A oneway sensitivity analysis of the base-case analysis showed that CA125 testing was more cost-effective than cytoreductive surgery followed by adjuvant chemotherapy when there was a 20% cost increase and/or a 5.5% quality-adjusted life year (QALY) increase. A negative threshold analysis also showed that CA125 testing was cost-effective for the tested range of CA125 values. Patients with newly diagnosed epithelial ovarian cancer should be screened for recurrence based on CA125 levels rather than receiving a confirmatory test. A confirmatory CA125 test is not cost-effective after an initial CA125 level has been obtained in patients treated with surgical cytoreduction and adjuvant or primary chemotherapy. 2edc1e01e8

j2mod comes in two parts: j2mod-modbus is a library that provides an interface between the jamod Modbus library and j2mod. It is structured such that you can simply replace the original jamod library with the j2mod library. j2mod-comm is a command line tool that provides an executable interface for j2mod and allows for easy modifications of the TCP/IP parameters used by jamod. It is important to note that these libraries were developed to comply with RFC 1413 and for that reason j2mod does not depend on any other libraries than jamod and j2mod. You can download j2mod-modbus from here and j2mod-comm from here. See also: Features: Supports a Modbus-TCP Protocol. Supports the documentation and Javadocs of jamod. Building it from source In order to use j2mod you will need to build it from source. This can be done either in Java with the j2mod source code or directly with j2mod-comm. j2mod source code With j2mod source code, building and using j2mod is as simple as: From the j2mod-modbus directory, type: cd jamod-0.5.1 make ./j2mod-modbus ./j2mod-modbus You will be prompted for password. The password is the password of the domain you want to use (Default password is 'j2mod'), be sure to remember it. Once you enter the password, the module will start, and you will be asked if you want to debug your code. If you choose 'no' the output will be directed to the standard output instead of being sent to your computer. If you choose 'yes' then you will see the process going through the code until it returns. The output generated by the program will be: connect() Receiving a Start message dta(1) Reply (P)I (RQ) End the connection disconnect() Responding to a Start message dta(1) PIOF End the connection j2
