Installing Adobe Photoshop is relatively easy and can be done in a few simple steps. First, go to Adobe's website and select the version of Photoshop that you want to install. Once you have the download, open the file and follow the on-screen instructions. Once the installation is complete, you need to locate the patch file and copy it to your computer. The patch file is usually available online, and it is used to unlock the full version of the software. Once the patch file is copied, you need to run it and then follow the instructions on the screen.

Lightroom 5's biggest mistake is that it offers only a free upgrade. If you stop using the program, you need to purchase it. I can't quite understand why, when the same price is used for both. If you are an existing customer, that is a great move, but can we just offer a pro version for existing customers. Some of us already own Lightroom or prefer it over Photoshop. Another aspect of Photoshop that one may expect to see improved is in the editing. While it is nice to see that the tool finally has a Spot Healing tool that makes simple mistakes reusable, and even character removal is a step in the right direction, more advanced editing is still missing. For example, it would be great if this tool would allow us to hold multiple selection handles at the same time, as is now possible in Photoshop. Hopefully, we will see this feature in future releases. In addition, vectorizing the objects is one thing, but listing the image is another. Photographers work with various editing levels all day, but not as accurate as Photoshop does it. So where are the files? Unfortunately, until we see what actually happens between the import and the export, we can't be sure whether the image is saved to the original location. This is also a hard question to judge. All in all, it is just a small issue and not the biggest problem in any way. The truly great implementation is the feature of preserving EXIF. More improvement over Photoshop for motion is likely in the future, and it is a trend across the board. With Photoshop touching motion and increasingly video, Adobe recently outlined its vision for the next five years. While it's worth reading the official explanation, the company also posted a video here. It's certainly set to continue developing new technology that will improve editing. I'm curious to see what Adobe chooses to do with Photoshop in motion when it speaks to Motion again at NAB 2015.
